

Information architecture · home

The whole homepage is one console. A persistent ask bar at the bottom is always present – that's the AMA. Panels around it surface the rest. Visitors who chat get conversation; visitors who scan get the bio anyway.

ASK ALLISON

GEMINI · V1.5

> where did you intern?

Database research at Huawei (2024), and compiler research at McMaster the year before. Both made me realize I like working close to the metal – small teams, hard problems, slow feedback loops.

what's your stack?

favorite project?

what do you do for fun?

where can I reach you?

AMA

↗ persis.

What's on v1

- **Identity strip** – name, role, location, clock
- **AMA panel** + persistent ask bar (Gemini free tier, proxied)
- **Now panel** – activity, day %, current track
- **Latest** – most recent GitHub commit (public API)
- **Day** – vertical timeline lit by visitor's clock
- **LeetCode** – manually-curated stats or unofficial endpoint
- **Projects** – 4-6 curated entries
- Single page; `/posts/*` exists but empty in v1

v2 backlog (not built, not lost)

- Blog / long-form posts
- Spotify OAuth (real "now playing")
- WakaTime integration
- Calendly booking
- LeetCode challenge mode (solve + compare)
- Rich co-op write-ups (or surface fully via AMA)

Reply in terminal – does this layout work, or do you want to swap panels around / cut something / add something?
